

First to set the static IP address in Windows Server 2022.

Then, we setup the Active Directory through server manager.

Now, the setup we made worked and is showing that LAB/Administrator

The DNS screen showing 192.168.10.10 entered.

Caption: "Configured the Windows 11 client's DNS to point to the domain controller (192.168.10.10) so it can locate the lab.local domain."

Why: this tells the laptop "ask the server to find the company." Without it, Win11 can't find lab.local.

Activation page showing **Windows 11 Pro**.

Caption: "Upgraded the Windows 11 client to Pro edition, enabling domain-join capability required to join the lab.local domain. Upgraded the Windows 11 client from Home to Pro edition using changepk.exe, enabling the Active Directory domain-join capability."

Caption: "Successfully joined the Windows 11 client to the lab.local domain, placing it under central management by the domain controller."

 Caption: "Logged into the Windows 11 client using the domain account (Administrator@lab.local), confirming centralised authentication across the domain."

"Opened Active Directory Users and Computers to manage domain users and groups."

"Created Organizational Units (IT, HR, Finance) to organise users by department."

Caption: "Created and organised six user accounts across IT, HR, and Finance departments, simulating a real company staff directory."

"Created department security groups (HR-Team, IT-Team, Finance-Team) and assigned users, enabling group-based access management."

"Understood how group membership stacks permissions, and why least-privilege access control prevents privilege creep."

Opened Group Policy Management to configure domain-wide security and user settings

"Configured a domain password policy enforcing a 12-character minimum and complexity requirements across all accounts."

Enabled a company-wide Desktop Wallpaper policy via Group Policy, applied across all domain users.

Created and shared a network folder (CompanyShare) on the domain controller for centralised file access.

"Configured Group Policy to auto-map network drive S: to the shared company folder for all domain users at login."

"Resolved a Kerberos time-sync error using w32tm /resync, then successfully applied all domain Group Policies (Computer + User) to the client."

The screenshot shows a Windows Command Prompt window titled "Administrator: Command Prompt". The window contains the following text:

```
e able to use some functionality on the network. Windows will periodically attempt
to retry this operation, and it is possible that either this system or the domain
controller will correct the time settings without intervention by an administrato
r, so the problem will be corrected.

If this issue persists for more than an hour, checking the local system's clock se
ttings to ensure they are accurate and are synchronized with the clocks on the net
work's domain controllers is one way to resolve this problem. A network administra
tor may be required to resolve the issue if correcting the local time settings doe
s not address the problem.
User Policy update has completed successfully.

To diagnose the failure, review the event log or run GPRESET /H GPREport.html fro
m the command line to access information about Group Policy results.

C:\Users\Administrator>w32tm /resync
Sending resync command to local computer
The command completed successfully.

C:\Users\Administrator>gpupdate /force
Updating policy...

Computer Policy update has completed successfully.
User Policy update has completed successfully.

C:\Users\Administrator>
```

The taskbar at the bottom shows the Windows Start button, search icon, and several application icons. The system tray on the right shows the date and time: 9:03 AM, 19/08/2026.

"Diagnosed a failed network share by comparing ping results — confirmed the hostname was mistyped while the server IP (192.168.10.10) responded successfully, isolating the issue to name resolution."

The screenshot shows a Windows Command Prompt window with the following text:

```
C:\Users\Administrator>gpupdate /force /target:user
Updating policy...

User Policy update has completed successfully.

C:\Users\Administrator>ping WIN-CPD030P8FES
Ping request could not find host WIN-CPD030P8FES. Please check the name and try ag
ain.

C:\Users\Administrator>ping 192.168.10.10

```

A context menu is visible over the bottom right of the window, showing "English (United States)" and "US" as the selected input method. A tooltip at the bottom of the menu says "To switch input methods, press Windows key + space."

"Successfully accessed the shared company folder (\\192.168.10.10\\CompanyShare) from the Windows 11 client, confirming network file sharing works across the domain."

"Verified all Group Policies applied on the Windows 11 client: company wallpaper (LAB CORP) deployed and network drive S: auto-mapped, confirming full domain-wide policy enforcement."

Ticket 1: Password Reset of a user

"Reset domain user password (Asha Rai) and verified successful login on the client, confirming the fix end-to-end."

Ticket 2: Fixing locked out user

"Configured an account lockout policy (5 failed attempts) to protect against brute-force attacks."

"Verified account lockout policy: user account (Asha Rai) locked after exceeding failed login threshold, demonstrating brute-force protection."

"Unlocked the locked-out account and confirmed successful user login, resolving the lockout ticket end-to-end."

Ticket 3: "New employee starting Monday — set up their account."

"Onboarded a new employee — created a domain account and assigned department group membership."

Ticket 4: "Employee resigned — revoke their access."

"Offboarded a departing employee by disabling their account, preserving audit records per best practice."

Ticket 5: "Please add me to the Finance team's shared access."

"Modified group membership to grant a user access to department resources, demonstrating role-based access control."

Ticket 6: "I need software installed on my PC."

"Standard user (Asha Rai) blocked from installing software by User Account Control, demonstrating least-privilege enforcement."

"Completed the software installation by supplying administrator credentials via UAC elevation, following the 'run as administrator' workflow used in real help desk support."

Ticket 7: "My PC is running slow / is something wrong?"

"Investigated performance concerns using Task Manager to review resource usage and running processes."

Ticket 8: "I can't find the shared drive."

"Resolved a missing network drive issue by verifying Group Policy drive mapping (S:)."

Ticket 9: "Bulk-check — is user X's account active?" (PowerShell)

"Used PowerShell (Get-ADUser) to query domain account status."
